Cuendo el potencial efectivo posee on méximo, aparece la llamada esfera de fotones, lo que mos permite, a su vez, determinar la sombra de los aquiparos negros.

Ye que el méximo genera una érbita circular (inestable), tenemos r = r = 0en $r = r_0$, y así $r_0 = 0$. Mego,

$$= \frac{1}{2} \left[-\frac{1}{2} \frac{1}{2} \frac{1}{2} \frac{1}{2} + \frac{1}{2} \frac{1}$$
